THE CHALLENGE

THE Challenge – Scenario 1

DHL Logistics Operations teams handle thousands of messages and documents every day. These come from many different sources, such as:

- Chat messages from MS Teams or WhatsApp
- Long email threads between teams
- Screenshots used to explain steps or errors
- Handwritten notes or quick instructions shared informally
- Snippets of PowerPoint slides or training materials

All this information is important — but it is unstructured, scattered, and difficult to reuse.
Because of this, creating clean and standardized SOPs (Standard Operating Procedures) or Knowledge Base (KB) articles becomes extremely slow and inconsistent.

Your objective:
You are required to design and build a system that automates the entire transformation process — from raw messy input → to clean knowledge articles.

THE Challenge – Scenario 1

Your objective:
You are required to design and build a system that automates the entire transformation process — from raw messy input → to clean knowledge articles.

Minimum Viable Product (MVP):

Web App (Mandatory)	RPA - UiPath (Mandatory)	LLM (Optional)
Secured Website (Login)	Fetching raw inputs (emails, google drive)	Summarizing long text into simple steps
Upload raw information	Processing the input	Extracting key points from screenshots or long messages
Convert raw input into structured articles	Update the website	Rewriting chat/email messages into a clean SOP
Manage and search articles	Reporting (errors, summary)	Generating a clear article **title**

THE Challenge – Scenario 2

DHL's Customer Support teams receive a high volume of incident reports every day—late deliveries, address issues, damaged parcels, system errors, and customer complaints. These reports come through multiple inconsistent channels, such as:

- Email inboxes
- WhatsApp/Teams chat messages
- Phone call notes
- Images/screenshots of damaged packages
- Handwritten instructions from warehouse teams

Because the information is unstructured, incomplete, and inconsistent, it is difficult for DHL to:

- Identify the real issue
- Assign incidents to the correct department
- Prioritize incidents correctly
- Track resolution progress
- Produce consolidated reports for management

This leads to slow response times, repeated manual work, and inconsistent customer service quality.

THE Challenge – Scenario 2

Your objective:
You are required to design and develop an Incident Reporting System that automates the full process of collecting, understanding, assigning, and tracking incident reports.

Minimum Viable Product (MVP):

Web App (Mandatory)	RPA - UiPath (Mandatory)	LLM (Optional)
Secured Website (Login)	Fetching raw inputs (emails, google drive)	Extract the key problem
Upload raw information	Processing the input	Rewrite messy content into a clean summary
Workflow with incident status	Update the website	Detect Duplicate
Manage and search incident	Reporting (errors, summary)	Suggestion to classifying incidents

DAC - AUTOMATION CHALLENGE PATH

GENERAL INTERNSHIP

- Participate in an ongoing 6-month internship via the normal hiring process.

DIGITAL AUTOMATION CHALLENGE

- Short project which is open to **3rd and 4th year** students.
- Other criteria will be determined.

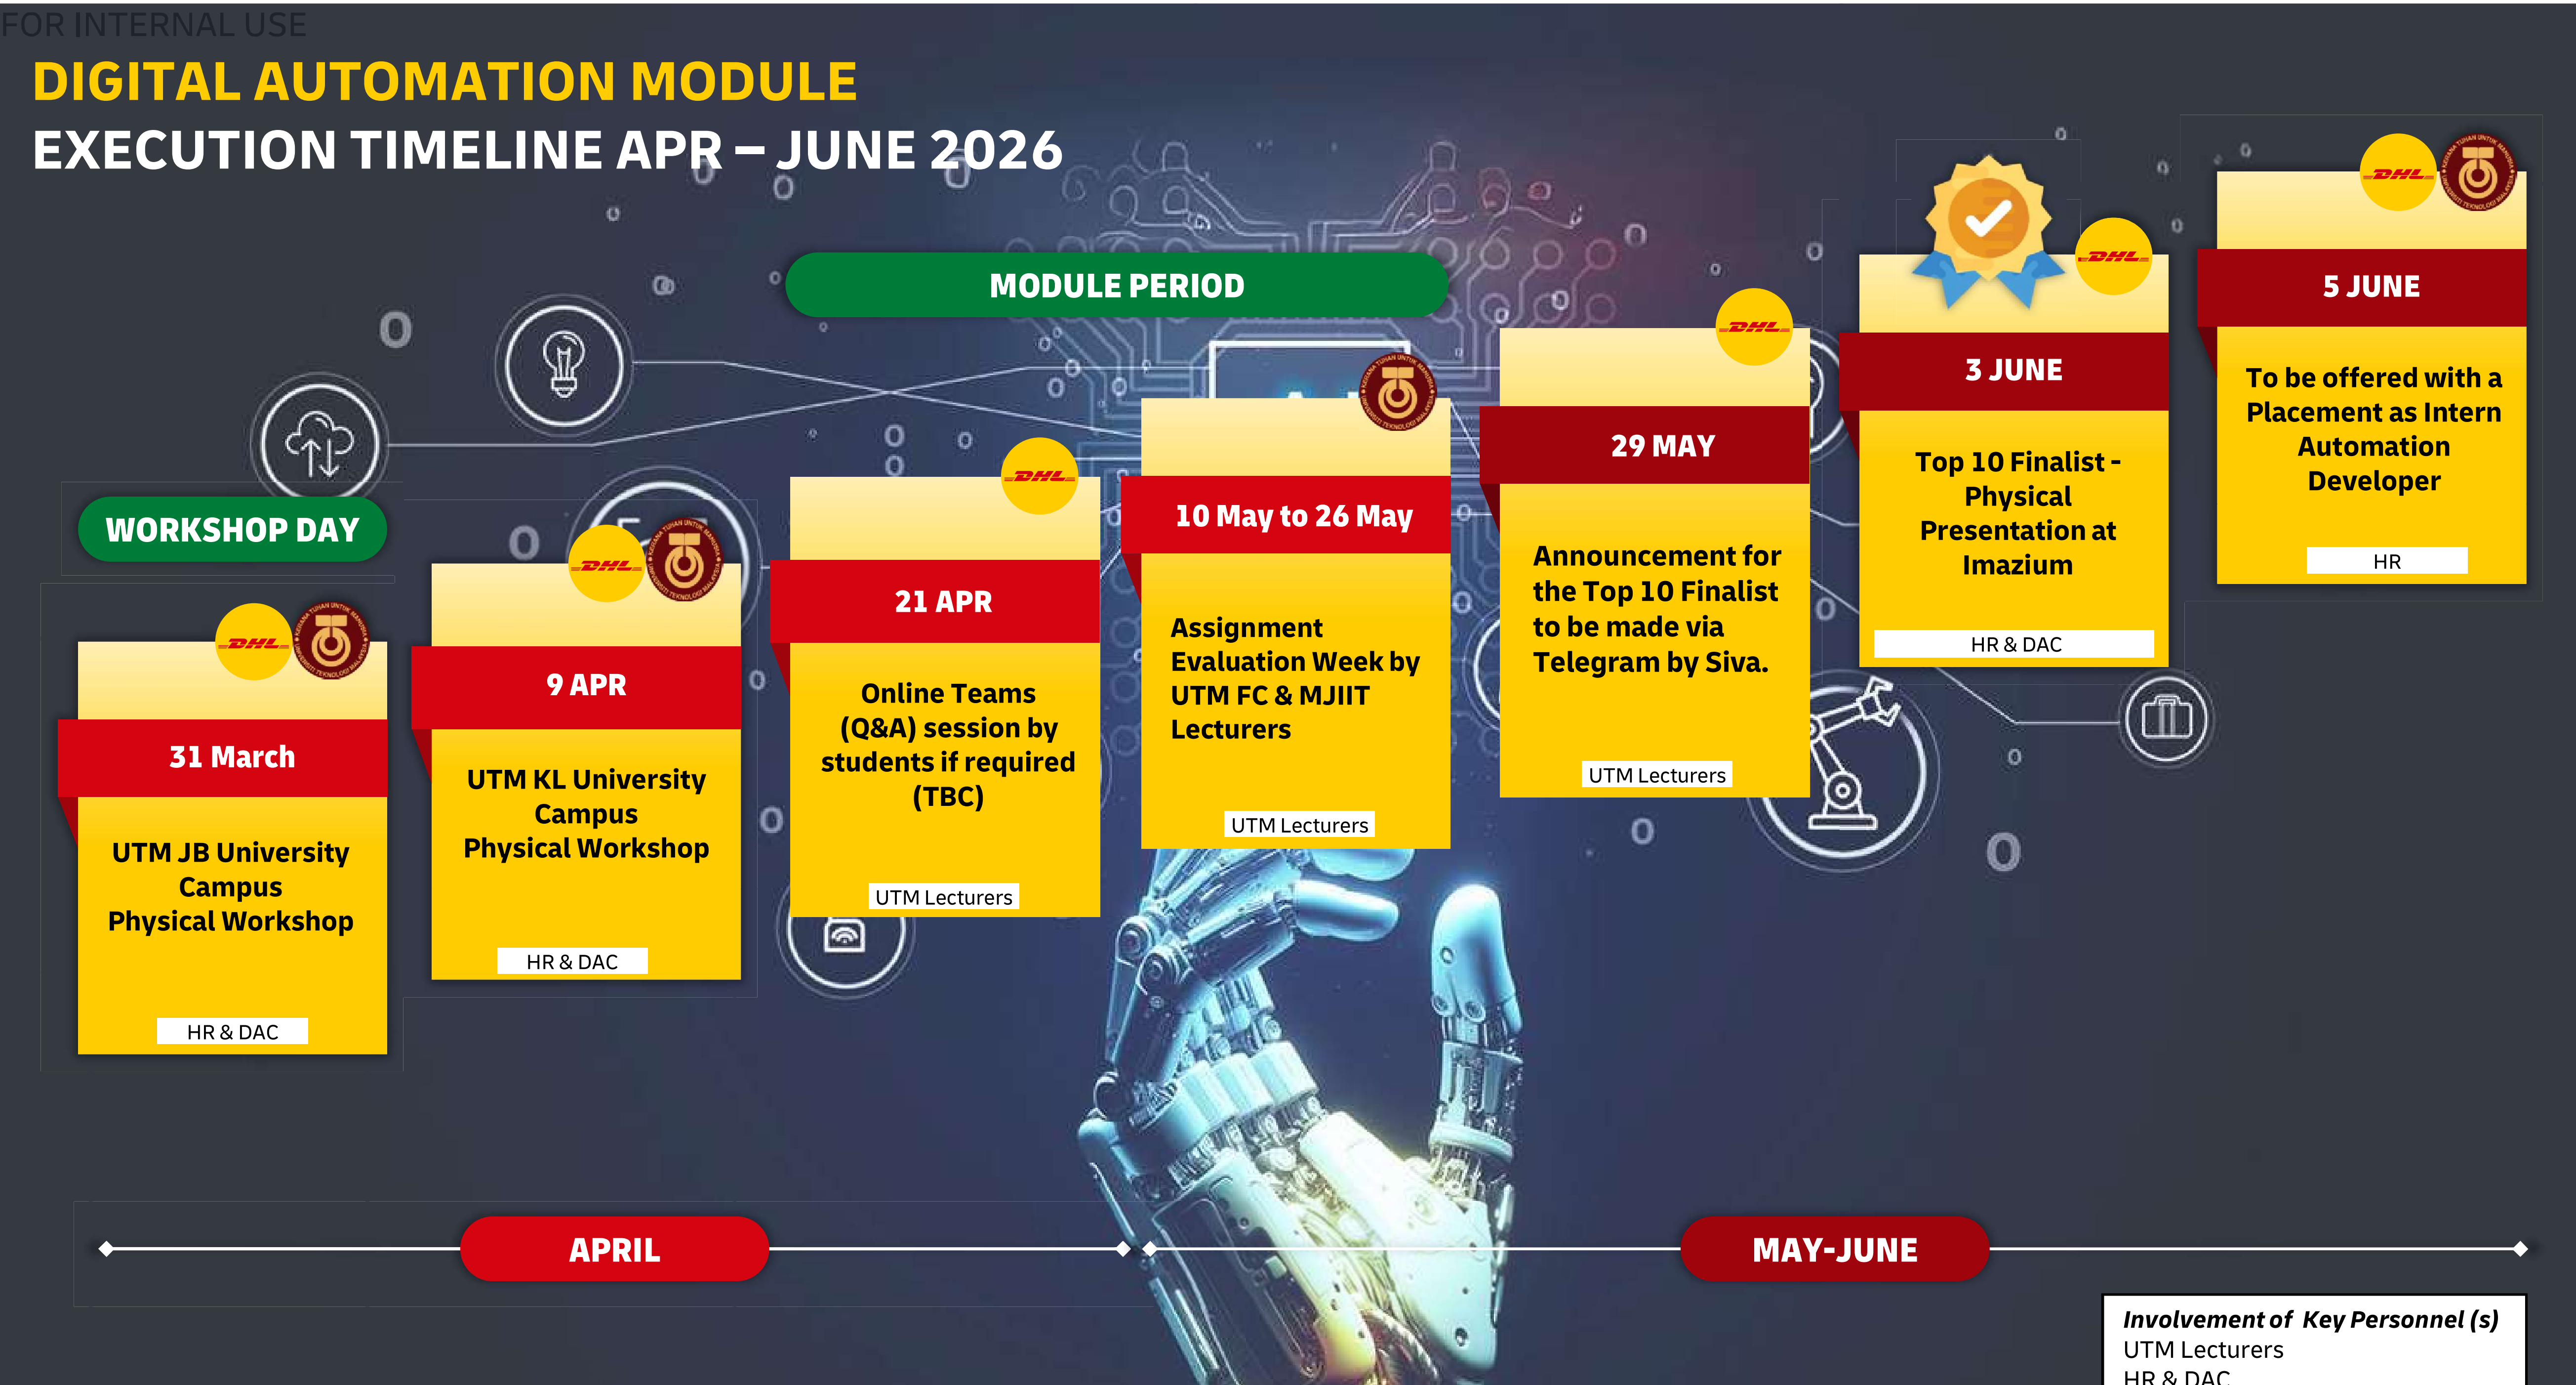
CAREER @ DAC

?

6-month Internship
Differentiated Allowance

Software Developer*
Permanent

**If there is an opening for Developer role.*



FOR INTERNAL USE
DIGITAL AUTOMATION MODULE
EXECUTION TIMELINE APR – JUNE 2026
MODULE PERIOD
WORKSHOP DAY
31 March
UTM JB University Campus Physical Workshop
HR & DAC
9 APR
UTM KL University Campus Physical Workshop
HR & DAC
21 APR
Online Teams (Q&A) session by students if required (TBC)
UTM Lecturers
10 May to 26 May
Assignment Evaluation Week by UTM FC & MJIIT Lecturers
UTM Lecturers
29 MAY
Announcement for the Top 10 Finalist to be made via Telegram by Siva.
UTM Lecturers
3 JUNE
Top 10 Finalist - Physical Presentation at Imazium
HR & DAC
5 JUNE
To be offered with a Placement as Intern Automation Developer
